VOLTAGE SURGE SIMULATION

The voltage surge simulator VSS 500N12.7 generates high voltage transients as required for Information technology equipment by the IEC 60950-1, IEC 60065 and ITU-T K.44 standards . The voltage surge pulses are used to test the isolation (voltage withstand) capability of components, sockets, connectors, cables and many other items. Spark over detection and voltage/current measuring functions are included in the generator.

BENEFITS

VSS 500N12.7 - 12KV VOLTAGE SURGE SIMULATOR

The VSS 500N12.7 is a surge voltage simulator specifically designed to test insulation material, components, sockets, connectors, cables and many more items to their voltage withstand capability. Testing the voltage withstand capability by means of a transient test pulse is the most common alternative to tests using a.c. or d.c. voltages.

By means of the built-in voltage and current monitors and the Spark Over Detection you are offered detailed test results to judge the quality of the EUT.

Safety precautions are taken to assure safe operation at this high voltage level. The VSS 500N12.7 provides interlock and warning lamp control. By means of an optional test box the operator can be further protected to avoid direct contact with high voltage and to avoid harm from exploding components or fragments of them when failing.

iec.control software for remote control and documentation allows fully automated testing.

OPERATION

EASY TO OPERATE

Front panel menu and function keys enable the user to program his test routines quickly and accurately. The cursor allows fast control of all test parameters of the programmed routine, thus test procedures are simplified and confidence is generated that every step is carried out correctly.

STANDARD INFORMATION

ITU-T IMPULSE TEST GENERATORS

The circuit in the figure below using component values in reference of Table K1 of the normative Annex K of the IEC 60065 standard.

The circuit reference 2 of Table K.1 generates 1,2/50 us impulses (1,2 us virtual front time, 50 us virtual time to half value) as specified in IEC 60950-1 and ITU-T Recommendation K.44 to simulate transients in power distribution systems.

The impulse wave shapes are under open-circuit conditions and can be different under load conditions.
